## 2.3   Runtime Deployment

Once a business solution is built and deployed in the Design Studio, move the generated files into the respective runtime deploy folders.

2.3.1   Business Process Server Deployment

This working folder file path is set during Business Process Server installation. This folder file path can be changed later by editing "path.deploy" property in the Business Process Server conf\config.properties file. By default, the folder is located under directory:

```
C:\Documents    and    Settings\[username]\PowerCurve\Business    Process
Engine\Deploy.
```

Deploy folder is created when the Business Process Server is started.

Business Process Server files can also be deployed from a centralised deployment server, which must be defined during Business Process Server installation. Centralised deployment allows multiple Business Process Engines to monitor a single deploy folder. By default, the centralised deploy folder is located at:

```
C:\Documents        and        Settings\[username]\PowerCurve\Centralised
Server\deploy
```

See **Originations Technical Overview** for further information on deployment.

TIP: Updated solutions and strategy files can be deployed on top of existing solution without restarting the Business Process Server.

1. Start the Business Process Server before deploying a solution.
2. Navigate to the **Deploy** folder under the Business Process Engine root folder.
3. Move solution bundles (previously deployed from design studio) into Deploy folder according to the following sequence:
